so that in the central position of the object the light is reflected from each face has the same intensity. In any other position, the intensity reflected from the two faces is not the same, and therefore the modulated light flux intercepted by the photomultiplier has a different wave form. A description is given of the electronic circuit and the servo-system element which produces the difference and produce the error signal which controls the position of the telescope through an electro-mechanical system. A calculation of the limiting sensitivity of the photoguide is reported and it is shown that the system can be reliably operated with stars of 5th magnitude and a guide diameter of about 10 cm. A particular feature of the guides is their simplicity and the inclusion of two phase asynchronous motors which are used to produce the error signal. The photoguides were tested at the Crimean Astrophysical Observatory on the 16" double astrograph and the 20" Licktelev telescope. There are 7 figures.

TITLE: Alternating current photoguide with analyzing optics for astronomical telescopes

SOURCE: Akademiya nauk SSSR. Kry. optika i optika kopt. konstr. va. Investigat. v. 11, Moscow, 1960, 11-183

TEXT: In the photoguides described by the authors, light entering the telescope from the object under investigation is divided into two or four beams by a bilateral prism or a quadrilateral pyramid respectively. The light beam is then modulated by a rotating disc and converted into electrical signals by a photo-multiplier. The signals are amplified and fed into a servo-system which corrects the position of the telescope so that the object remains in the required position in the field of view. Depending on the particular problem, the photoguide may be one coordinate or two coordinates. The one coordinate system is illustrated. In this system, light from the telescope is focussed on the edge of the splitting prism

ate system) or four-faced (for a two-coordinate system) glass prism which puts the light beam from the object being observed into 2 or 4 light beams. Each of the beams is transmitted through a mechanical light chopper (modulator) in the shape of a disc with slits or holes and applied next to the cathode of an antimony-caesium photomultiplier. The output voltage from the multiplier is amplified and applied to the control winding of a 2-phase asynchronous motor which shifts the optical axis of the photoguide together with that of the instruments, decreasing thus the tracking error. Analysis is given of operation of 1- and 2-coordinate photoguides. The procedure is suggested of calculating the limit sensitivity of a photoguide and the results of experiments with photoguides with assaying optics are given. 7 figures. AUTHORS: Sabinin, Yu.A., Belyayev, Ye.N. and Myasnikov, V.A.

TITLE: A.C. photo-guides with assaying optics for small diameter instruments

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika, no. 8, 1961, 40, abstract 8 V311 (Izv. Krymsk. astrofiz. observ., 1960, 23, 174-183)

TEXT: The principle is considered of operation of 1- and 2-coordinate photoelectric follow-up systems (photoguides) for guiding or correcting the movement of astronomical instruments. The purpose of photoguides is to determine the magnitude of the angular error between the optical axis of the instrument and the object being observed and to send a control signal to a drive which reduces this error to the required minimum. The photoguide component which determines the direction and the deviation of the object picture from the optical axis, is either a two (for a single ordin- X

TITLE: A study of the cytotoxic effect of staphylococcus toxin on tissue cultures. Report 1. Selection of the tissue culture most sensitive to the effect of staphylococcus toxin

SOURCE: Zhurnal mikrobiologii, epidemiologii i immunologii, no. 10, 1964, 32-37

TOPIC TAGS: toxicology, tissue disease, bacteria

Abstract: Eleven types of tissue cultures at various stages of growth (three primarily cryopreserved and eight re-inoculated strains) were tested with three standard Staphylococcus toxins. A Gay-oid culture of fibroblasts from a human embryo proved the most sensitive. The strength of the toxin depended on its age. On p. 37, Art. 2, table 1.

ABSTRACT: An Author Certificate has been issued for a device for checking the output of internal-combustion-engine oil pumps. The unit contains a casing, series-connected intake and overflow pipes, and a plunger for varying the cross-sectional area of the overflow pipe. To check the pump on a running engine, the pipes are mounted on an

Title : Certain Data Pertaining to the Structure of the Solar Plexus of Sheep.

Orig Pub: Tr. Novocherkasskogo zootekhn.-vet. in-ta, 1957, vyp. 10, 159-162.

Abstract: Certain peculiarities of the solar plexus of sheep, which may be either of a compact or scattered type (the first type is encountered more frequently), are described. In particular, it was noticed that the dimensions of the compact semilunar bundle are extremely unstable: in lambs, its length is 15 to 30 mm. and its width is 4 to 7 mm.; in adult sheep, it is 30 to 60 mm. and 7 to 12 mm., respectively.

determined by the K/Ar-method. The potassium content was determined by the dipicryl amine method. Argon was measured volumetrically. The isotope analysis of the separated argon was carried through by A. V. Mattes with the mass spectrometer MS-2m. The results are given in table 5, and they are in good agreement with the results of the calcium method provided the investigated sample was not recrystallized (Table 6). The authors thank A. N. Murin and L. M. Krizhanskiy for advice. There are 2 figures, 6 tables, and 14 references, 6 of which are Soviet.

TITLE:

Experimenting the Calcium Method for the Determination of
the Absolute Age of Sylvites (Opyt primeneniya kal'tsiyevogo
metoda dlya opredeleniya absolyutnogo vozrasta sil'vinov)

PERIODICAL:

Geokhimiya, 1958, Nr 8, pp 718 - 726 (USSR)

ABSTRACT:

The possibility of employing the calcium method for age determinations was investigated in this paper. Two samples of white sylvite from stratum "B", Verkhnekamskoye deposit, Berezniki, and one sample from Polovininskaya skvazhina (Irkutskiy amfiteatr) were examined. Calcium was separated from potassium by ion exchangers. For this purpose a new method was developed by the authors and controlled by means of the radioactive isotope Ca^{45} . An apparatus of the type B was used for the measurements. The separated calcium was determined by isotope dilution with Ca^{42} by the aid of the mass spectrometer MS-2m. The Ca^{44}/Ca^{42} - isotope ratio was determined again (Table 4). The resulting age data are given in table 2. For a comparison, the age was also

cooled, the critical points being determined. Below the eutectic-transformation temperature the specimen was held for 20 minutes and then finally cooled. The type of fracture was determined, polished sections were prepared and chemical analysis carried out. It was found (table) that the manganese content of the vacuum treated iron was 0.04-0.14% compared with 0.54-0.64 in the starting material, the corresponding figures for sulphur content being 0.007-0.008 and 0.042-0.069%, and for graphite 3.50-3.67 and 2.73-3.04. Silicon and phosphorus were unchanged at 1.7 and 0.14%, respectively. The vacuum treatment gave a reduction in the eutectic and an increase in the eutectoid transformation temperatures. The vacuum treatment did not affect the lamellar form of the graphite (Figs 2, 3) but the background changed from pearlitic to ferritic. A white iron (4.1% C, 0.18% Si, 0.2% Mn, 0.3% P) was also vacuum treated, after which it gave a grey fracture (Fig 4).

TITLE: Influence of Vacuum on the Changes in Critical
Temperatures, Structure and Chemical Composition of
Cast Iron

PERIODICAL: Fizika metallov i metallovedeniye, Vol 8, 1959, Nr 5,
pp 747-751 (USSR)

ABSTRACT: The authors give a brief account of the small amount of work (Refs 6, 7, 8) on the vacuum treatment of cast iron and go on to describe their own experiments. These were carried out in a type TGV-1 vacuum furnace with molybdenum elements (Fig 1), in which a residual pressure of 10^{-4} mm Hg could be produced. Iron was cast into special sand moulds (Ref 10), the critical temperatures being determined during the cooling. A 35-36 mm long section was cut from the ingots and machined into a crucible-shaped piece with an axial thermocouple hole 3.5-4 mm in diameter. The piece in its crucible was placed in a larger crucible on a refractory support in the furnace, the whole being covered with a bell-jar connected to the pumping system. After slow melting and holding for 30 minutes at about 1250 °C the iron was

TITLE: Some results of comparing radiosonde and aircraft measurements of turbulence in the free atmosphere

SOURCE: Tsentral'naya aerologicheskaya observatoriya. Trudy, no. 63, 1965. Voprosy dinamiki atmosfery (Problems of atmospheric dynamics), 109-113

TOPIC TAGS: atmospheric turbulence, free atmosphere, aircraft bump, aircraft measurement, radiosonde measurement

ABSTRACT: Measurements made from aircraft of atmospheric turbulence are compared with radiosonde measurements (with an overload attachment) to determine the value of radiosonde data for predicting turbulent zones over air routes. To test the method it was necessary to make experimental plane flights to measure bumpiness intensity over the same area with the radiosonde measurements. Analyses showed that there were zones in which there was good agreement between data from the two sources, including agreement concerning the thickness of the disturbing zone. However, in other cases it was found that although radiosonde and airplane data simultaneously detected dis-

such parameters as air temperature, humidity, pressure, wind velocity and wind direction. Turbulence was measured mostly by balloon-borne radiosondes with an A-22-III accelerometer attached. Sufficient data have been collected (457 radiosonde ascents in 1961-62) to determine a turbulence pattern over the aforementioned localities. Turbulence occurs with the highest frequency in the 1-2 km ground layer, it then decreases reaching a minimum at 6-7 km and then reaches a maximum again at 10-12 km. Data were analyzed to determine other turbulence characteristics depending on location, season, altitude, etc. It was noted that turbulence generally depends on thermal and dynamic stratification in the atmosphere and frequently occurs during pronounced vertical wind and temperature gradients. Two turbulent layers are frequently observed: one above the jet stream and one below it. Turbulence is minimal on the jet stream level. It was also observed that over Moscow and Sukhumi the turbulent layer seldom exceeds 200-400 m and only over Tashkent at 5-7 km is it ever more than 1000 m thick. The experimental work was carried out by the Central Aerological Observatory, Moscow. Also

The humidity sensor is a specially processed animal membrane. A special support extending from the nose of the aircraft supports the temperature, temperature fluctuation and pressure sensors. The pressure sensor employs an aneroid unit of phosphor bronze. An MP-23 potentiometric sensor, placed at the center of gravity of the helicopter, is used to detect aircraft overloads. The range of measured overloads is ± 1.5 g. The five meteorological parameters are recorded simultaneously with a K-12-21 oscillograph. Air temperature is determined with a maximum error less than ± 0.5 C in the range from -20 to +30C, temperature fluctuations are measured in the range ± 3 C with a maximum error less than ± 0.2 C in the frequency range from 0.01 to 5 cps, the relative humidity unit determines this parameter with a maximum error less than $\pm 7\%$ in the range 25 to 100%, the pressure unit measures pressure in the range 1025 to 700 mb with a maximum error not exceeding ± 3 mb. The apparatus has been tested on 50 flights with a total duration of about 110 hours. Orig. art. has: 7 figures.

TOPIC TAGS: meteorology, meteorological instrument, meteorograph, electrometeorograph, helicopter electrometeorograph

ABSTRACT: A helicopter electrometeorograph was developed by the Tsentral'naya aerologicheskaya observatoriya (Central Aerological Observatory) in 1960. The instrument is used for highly accurate measurement of temperature, temperature fluctuations, pressure, air humidity and helicopter overload. All these parameters are converted into electric pulses. A block diagram is shown as Fig. 1 of the Enclosure. The instrument is broken down into units for easy placement on a helicopter where space is at a premium. The temperature sensors are three resistance thermometers manufactured from a special platinum wire 0.06 mm in diameter; the resistance of each thermometer is approximately 130 ohms (at $t = 20C$).

Metals Engineering Handbook. v. 2.	871
Multiple-strand helical springs	867
Construction and use of springs	867
Flat spiral springs	868
Construction and use of springs	868
Characteristic of a flat spiral spring	869
Curved spring clips	870
Belleville springs	870
Construction and use	870
Design of Belleville springs	871
Cone-ring springs	872
Design, production and use of springs	872
Design of cone-ring springs	873
Lubrication, Lubricating Devices and Seals (Candidate of Technical Sciences Push, V. E.)	875
Lubricants	875
Lubricating devices	895
Design of lubrication systems	909
Mechanical Drawing (Engineer Sleznikov, G. I.)	910
Card 18/19	

Metals Engineering Handbook, v. 2.

871

Springs and Their Design (Doctor of Technical Sciences Ponomaryev, S.D.)	839
Material for springs	839
Selection of allowable stresses	843
Wound springs	844
Classification of springs	844
Cylindrical helical springs	846
Helical tension-compression springs	846
Calculation of cylindrical helical tension-compression springs of round cross section	849
Construction of tension springs of circular cross section	854
Construction of compression springs of circular cross section	855
Construction of springs of rectangular cross section	856
Design of composite (concentric) compression springs	857
Helical twist springs	857
Conical helical springs	859
Design of conical helical springs	862
Presetting helical springs	862
Calculation of preset cylindrical helical compression springs of cylindrical cross section	862
Calculation of springs for dynamic loads	866

Card 17/19

Metals Engineering Handbook, v. 2.

871

General information	744
Geometry and kinematics of worm gearing	745
Modified worm gearing	751
Cutting conventional worms and gears	752
Information on geometry of cone-drive worm gearing	754
Determination of acting forces and of efficiency of worm gearings	758
Thermal calculation of worm gearing	761
Types of failure of working surfaces of gears and materials	764
Examples of worm-gearing calculation	773
Designing worms and gears	777
Lubrication of worm gearing and lubricating devices	788

Tolerances for Gearing and Worm Gearing (Doctor of Technical Sciences
Tayts, B. A.)

Tolerances for spur gearing	792
Tolerances for bevel gearing	793
Tolerances for worm gearing	879
	828

Metals Engineering Handbook. v. 2.

871

Gear materials	680
Calculation for strength	680
Types of tooth failure and basic considerations for calculation of teeth working surfaces for wear resistance	683
Calculation of teeth for endurance	685
Instructions on tooth design for contact and bending stresses	687
Determination of allowable values for quantities $[C_k]_1$ and $[C_k]_2$	704
Instructions for bending calculations	707
Examples	712
Information on geared speed reducers	728
Schemes of multiple reduction units	728
Gear design	730
Working drawings of gears	734
Reducer housing	734
Lubrication of reducers	736
Selection of basic parameters for gearing design	737
Selection of ratio i	739
 Worm Gearing (Kudryavtsev, V. N.)	 744
Design and construction	744
Symbols	744
